Generating Encyclopaedia of Life pages for endemic South African spiders (Arachnida: Araneae)

C. Haddad, University of the Free State

We aim to generate data for 500 species of endemic spiders. - Data provided will include descriptions, behavioural, biological and habitat data, georeferenced locality records, distribution maps, as well as images of at least one of the sexes. - Where molecular sequences for a species exist, links will be provided to the sequences accessioned in the GenBank and BOLD databases. - In this process, updated information for the National Species list of spiders of South Africa, which is managed by SANBI, will be provided.
